PROJECT : 1
HIGHLY AVAILABLE STATIC WEBSITE

Launch EC2 in one availability zone

Configure security groups for HTTP and SSH

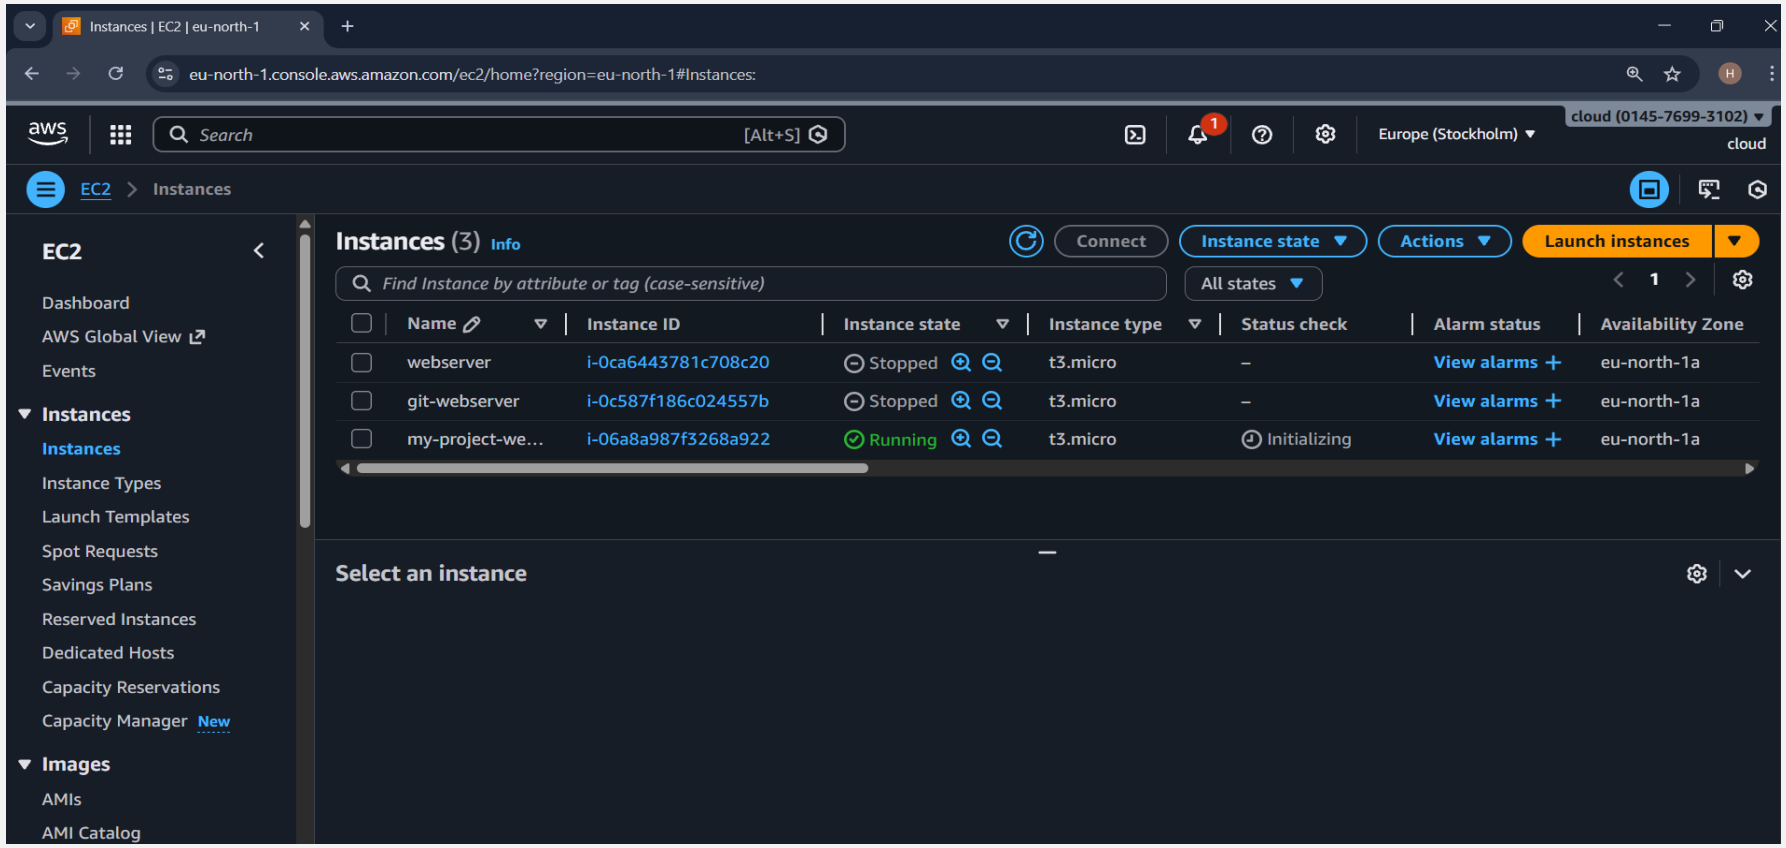
Attach EBS volume and host a static website

Store backups in S3

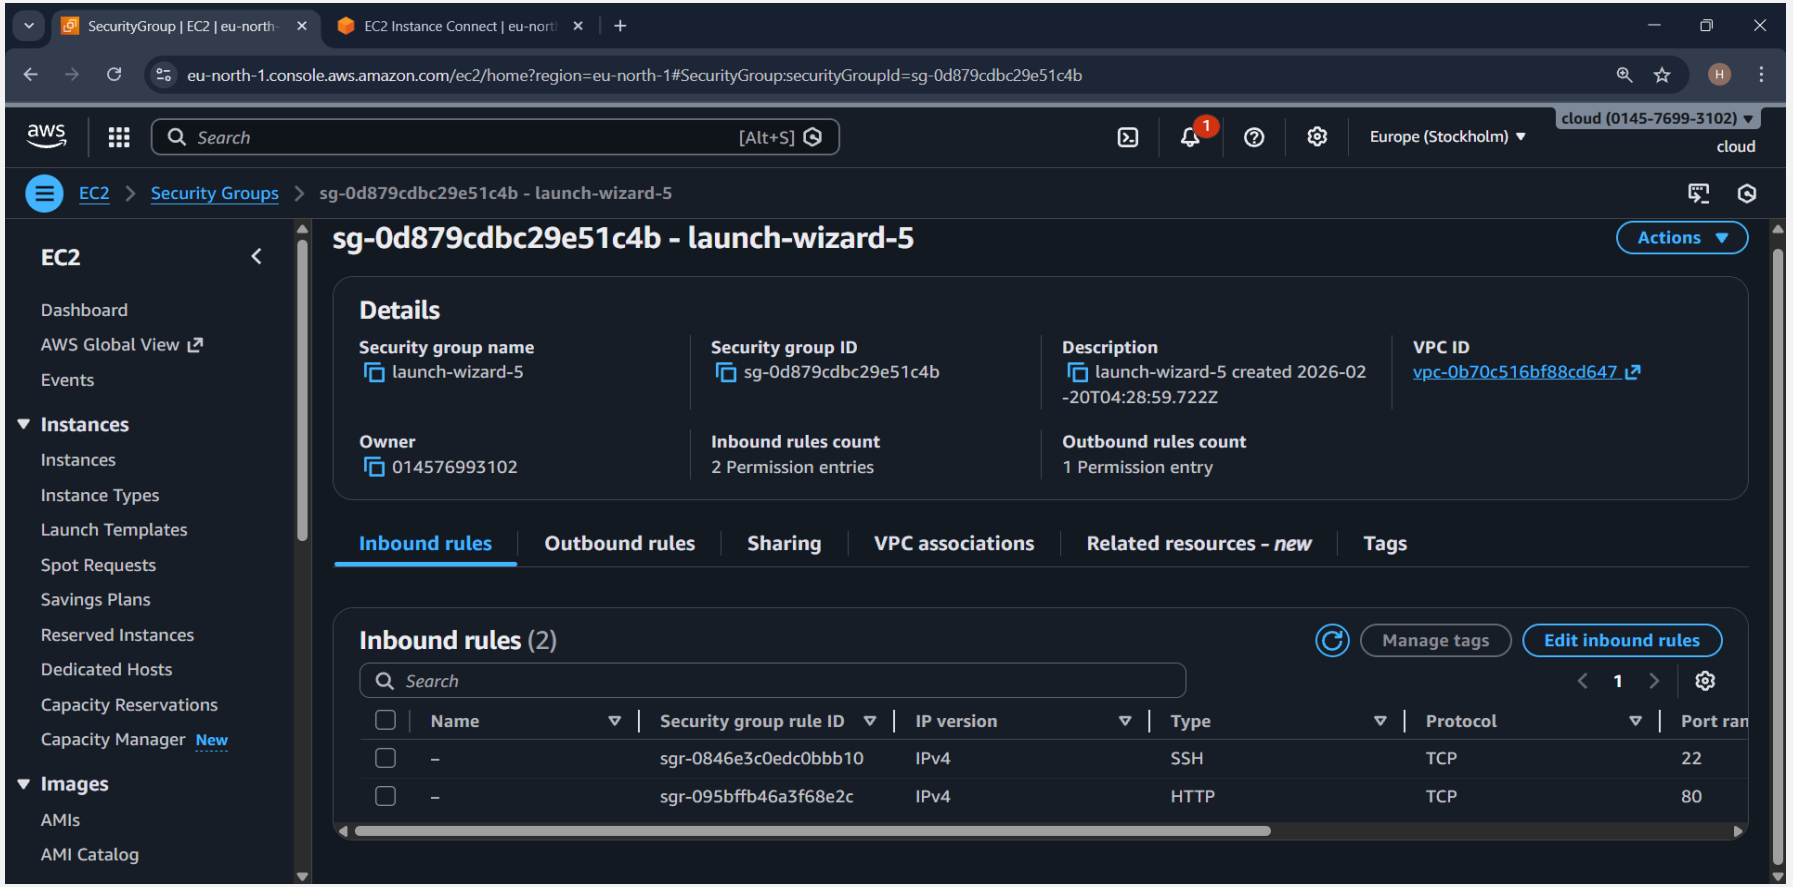
Create EBS snapshot and AMI

Launch EC2 in another AZ using AMI

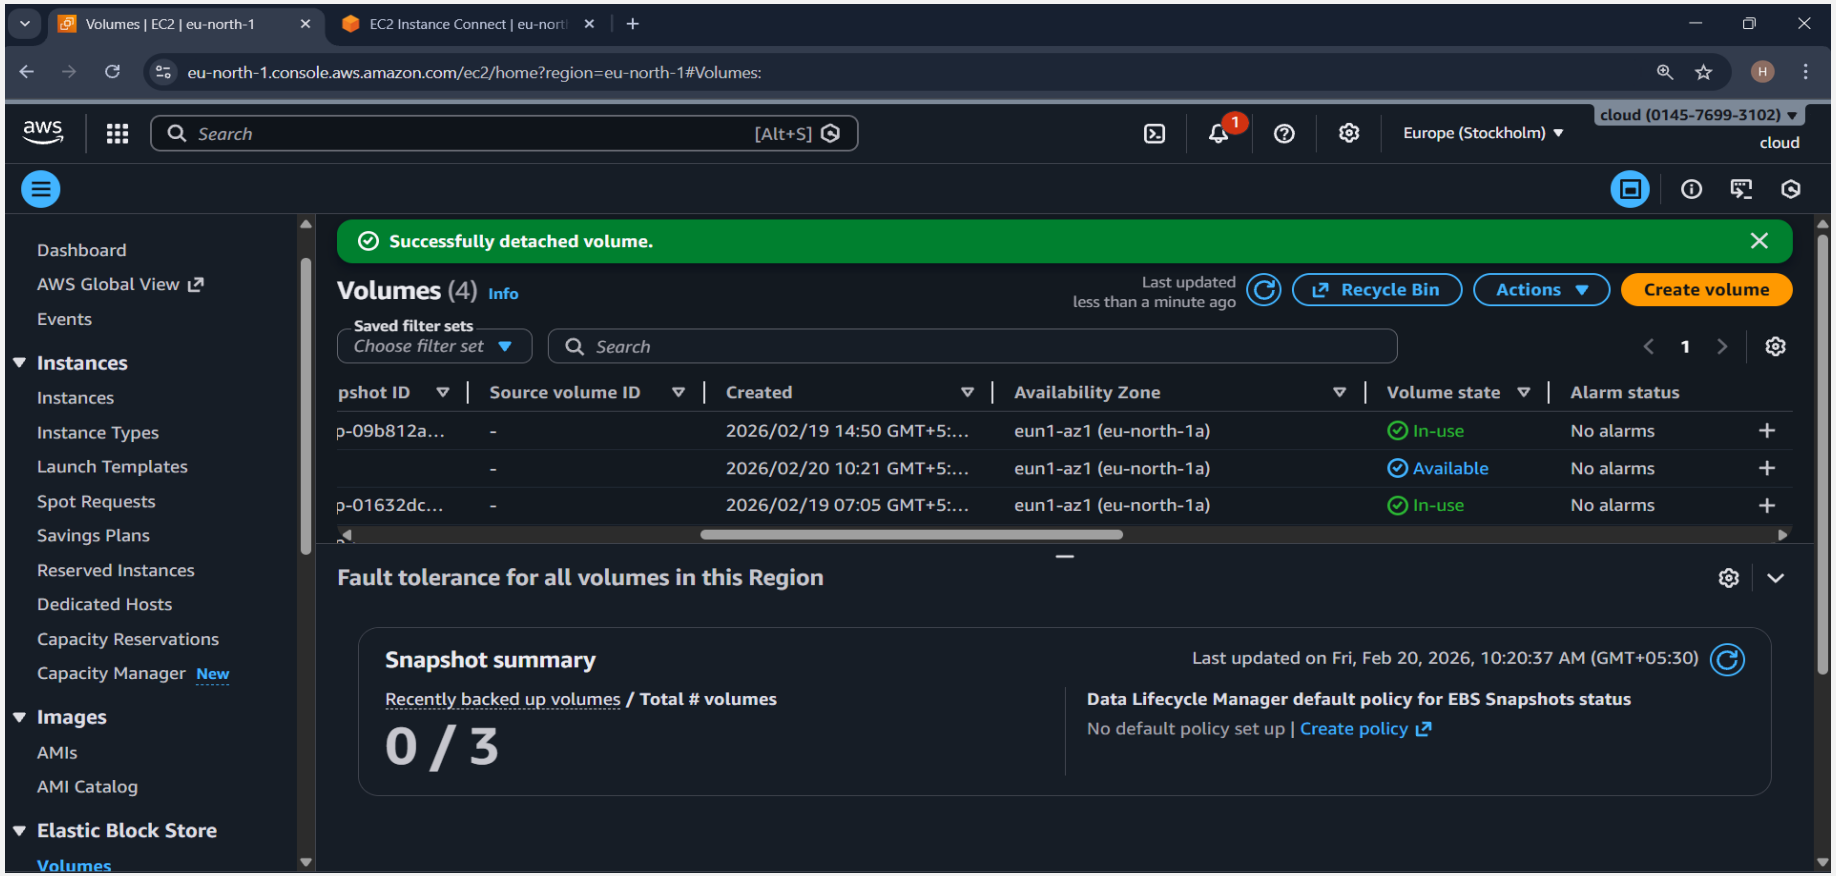
➢ Launch EC2 in one availability zone



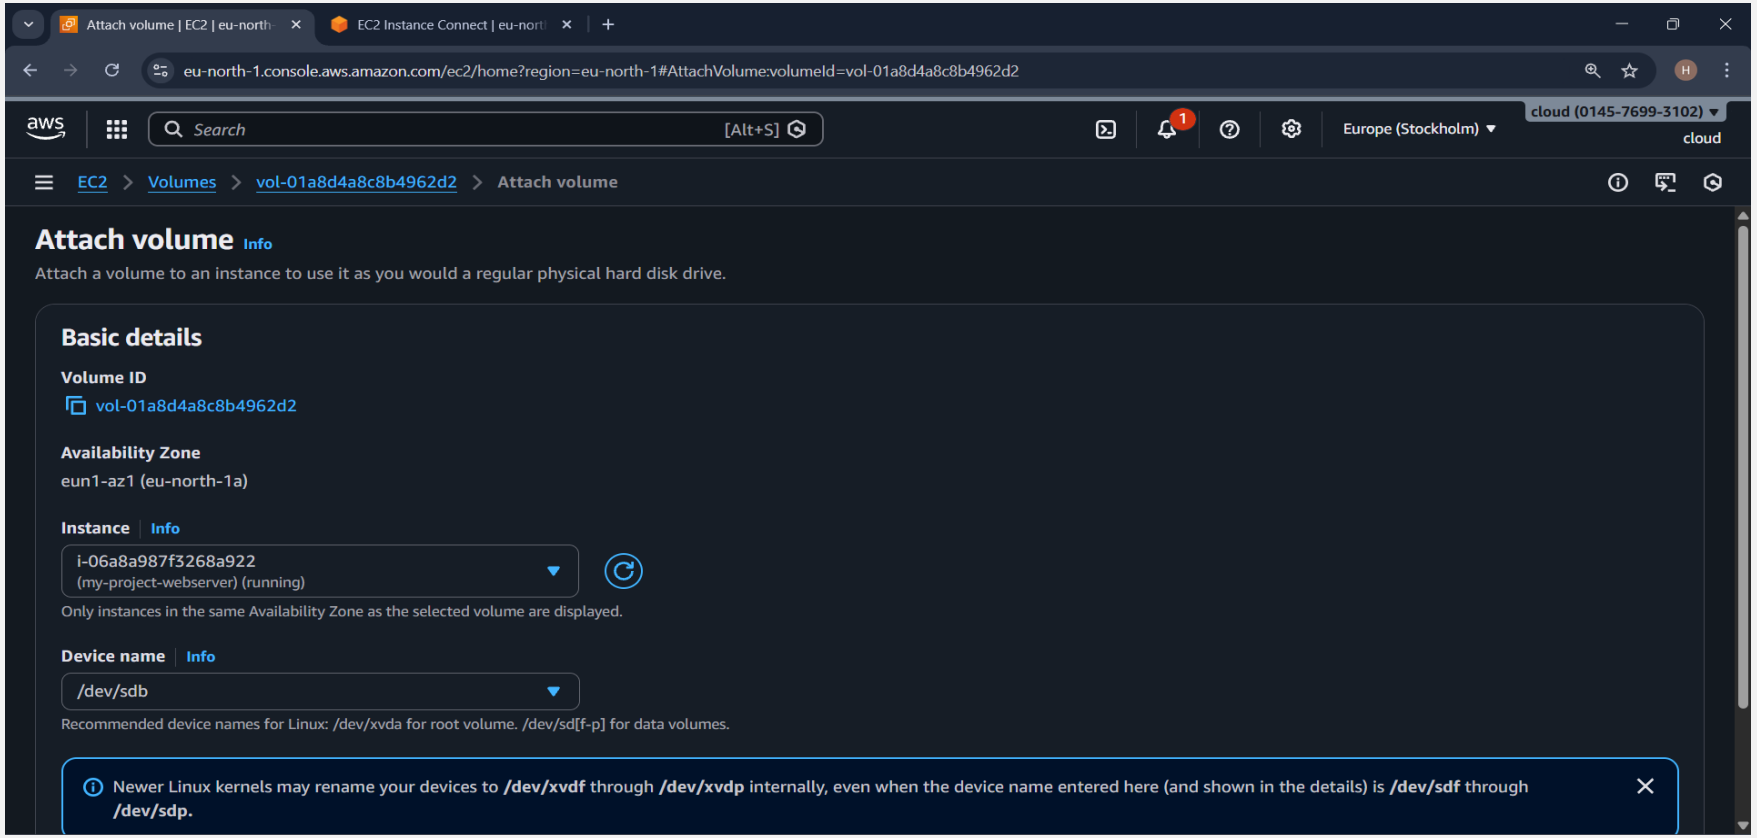
➢ Create new security group configure security groups (HTTP and SSH)



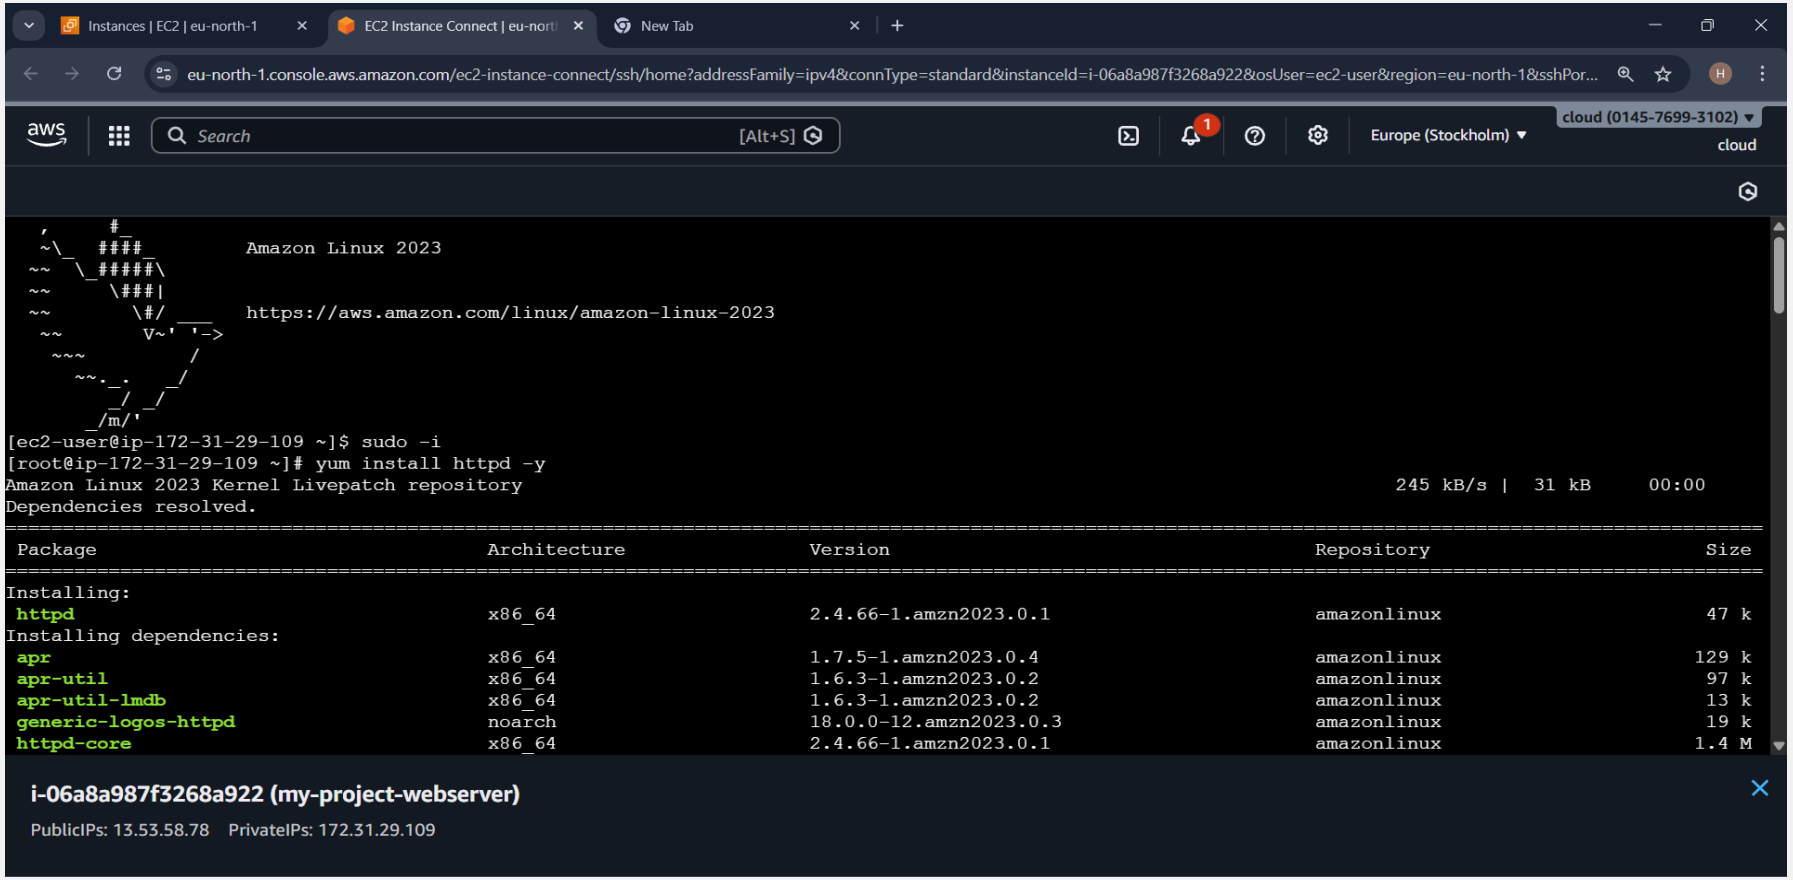
➢ Attach EBS volume and host static website create and attach volume to instance



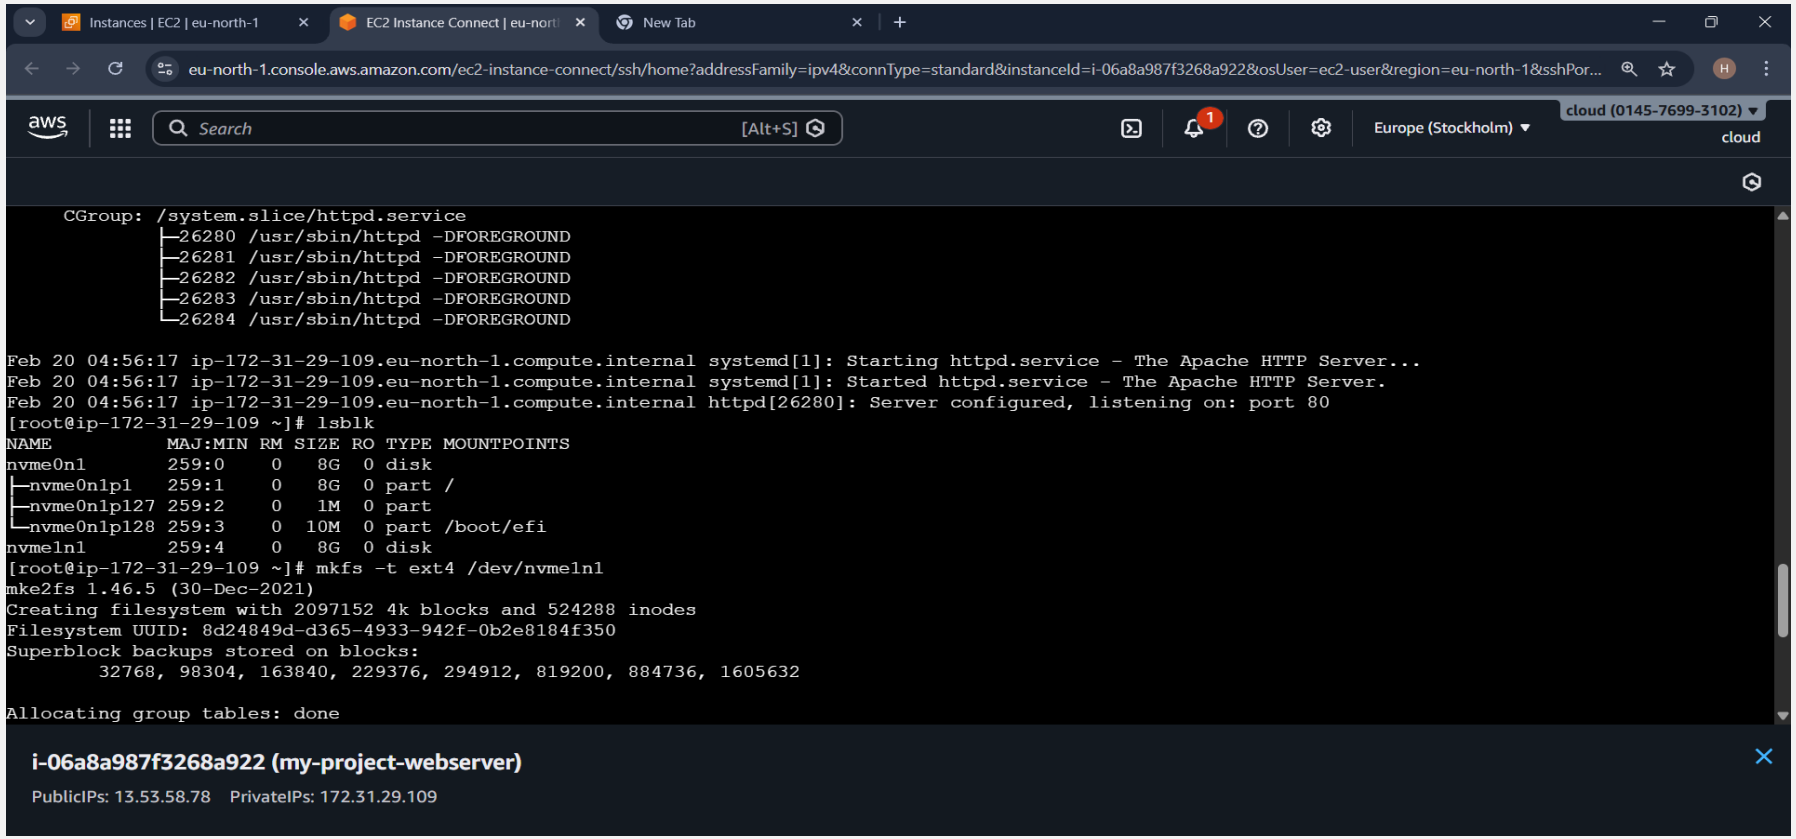
➢ Here we attach volume to an instance



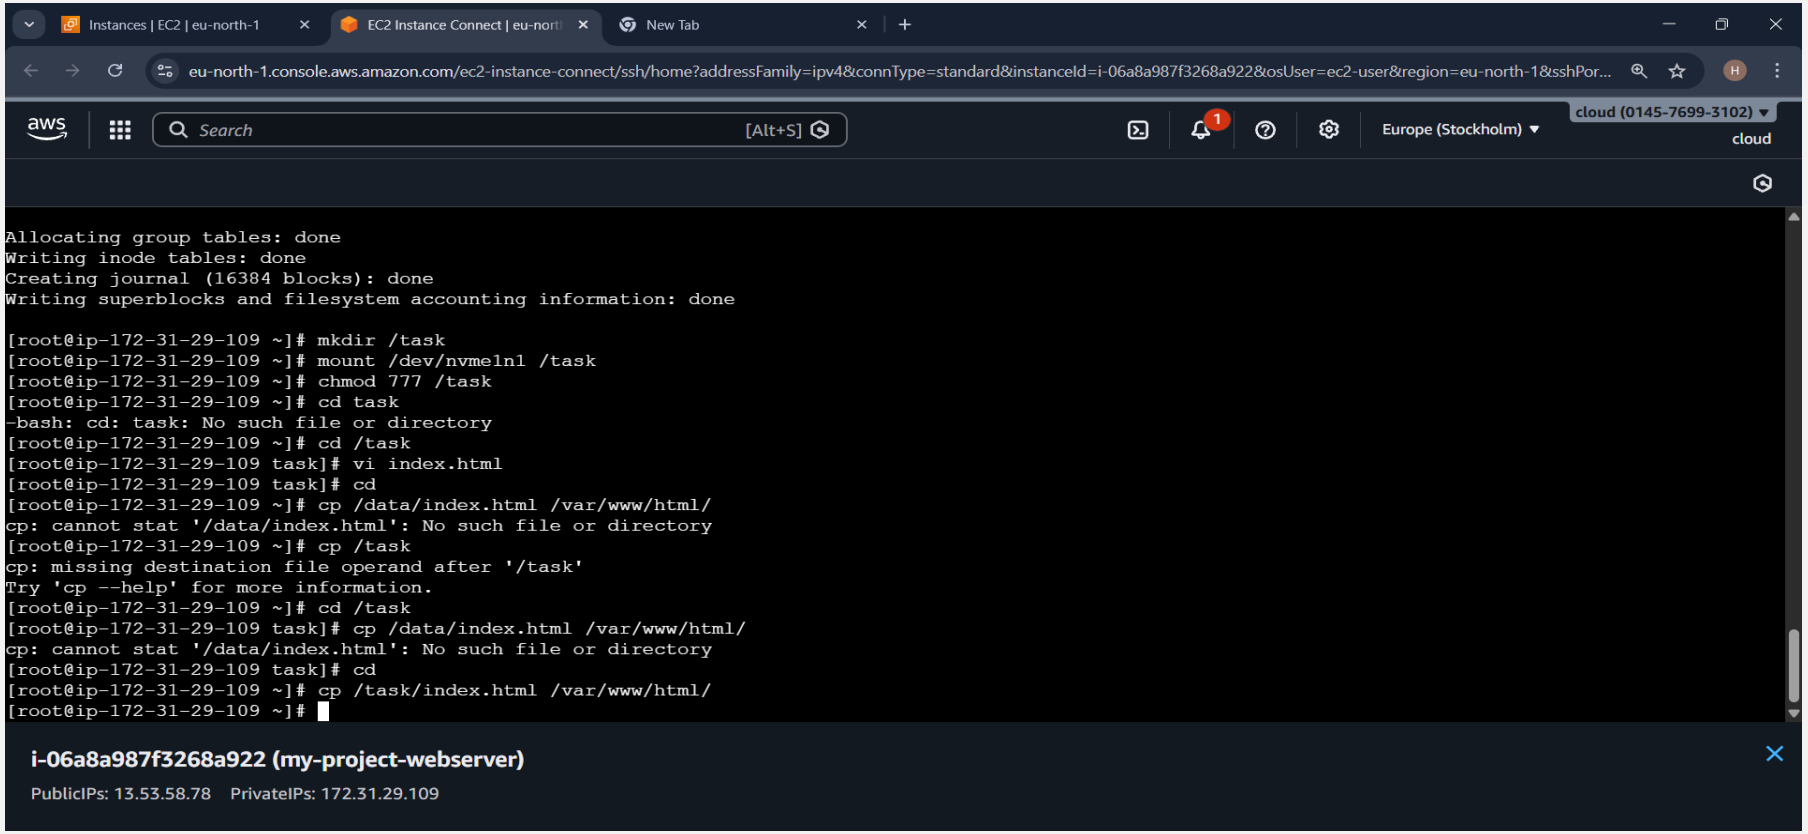
➢ Connect ec2 instance and install and start HTTPD



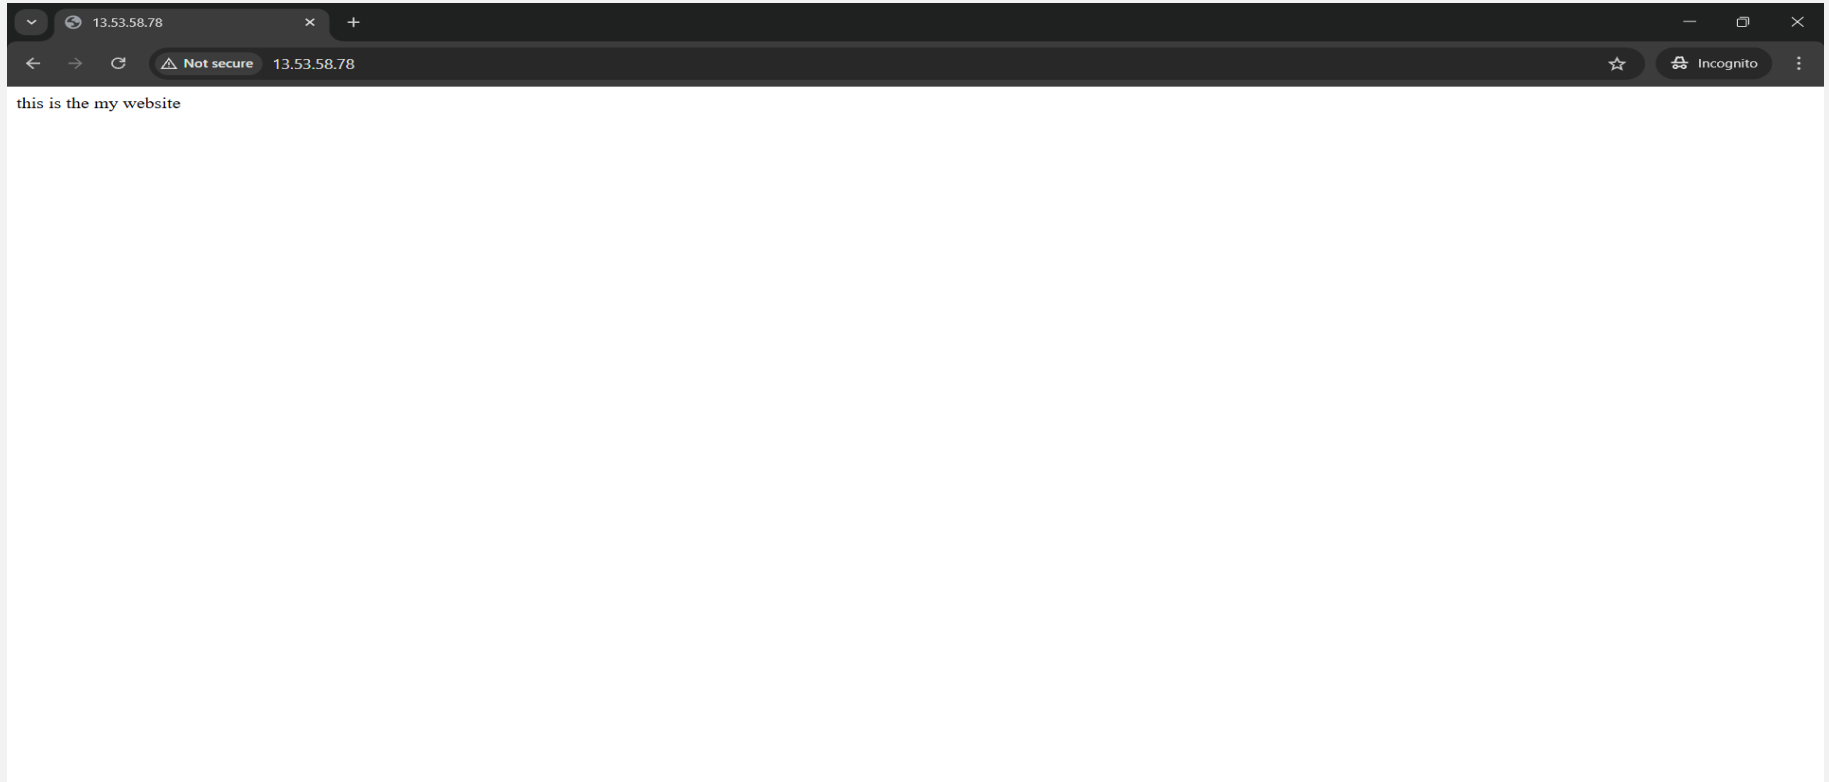
- Here we use lsblk display block info and mkfs –t ext4 /dev/sdb format a disk



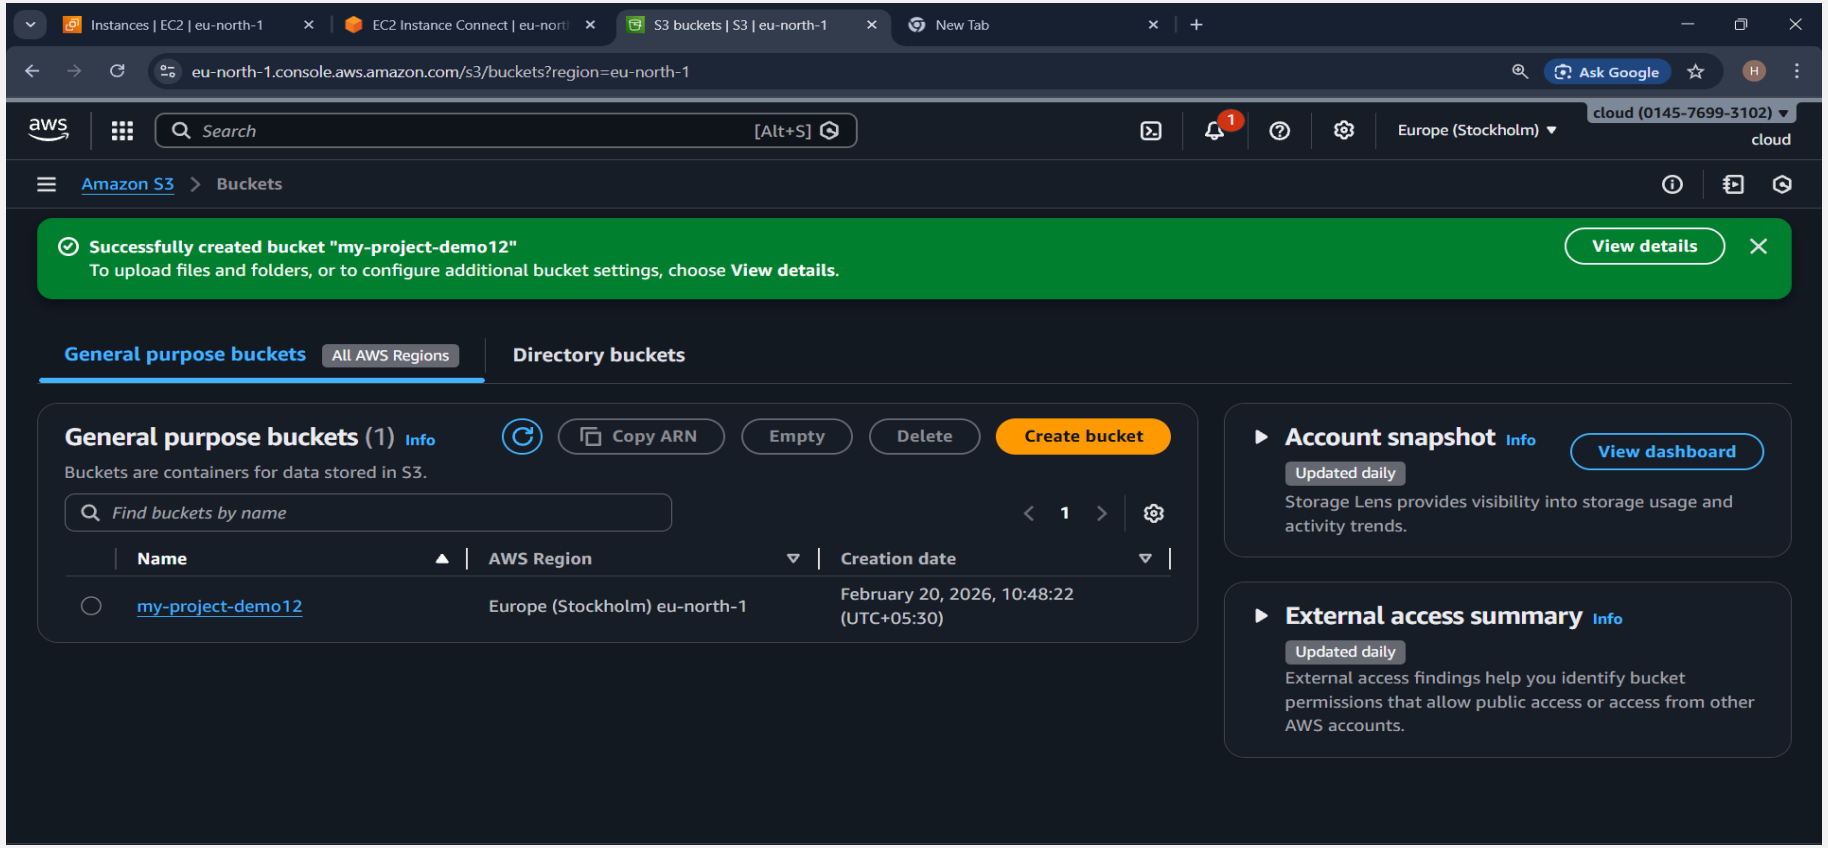
- Create directory and mount it
  in side that dir we create file index.html
  and we use cp command to copy index.html
  put into dir file as /var/www/html



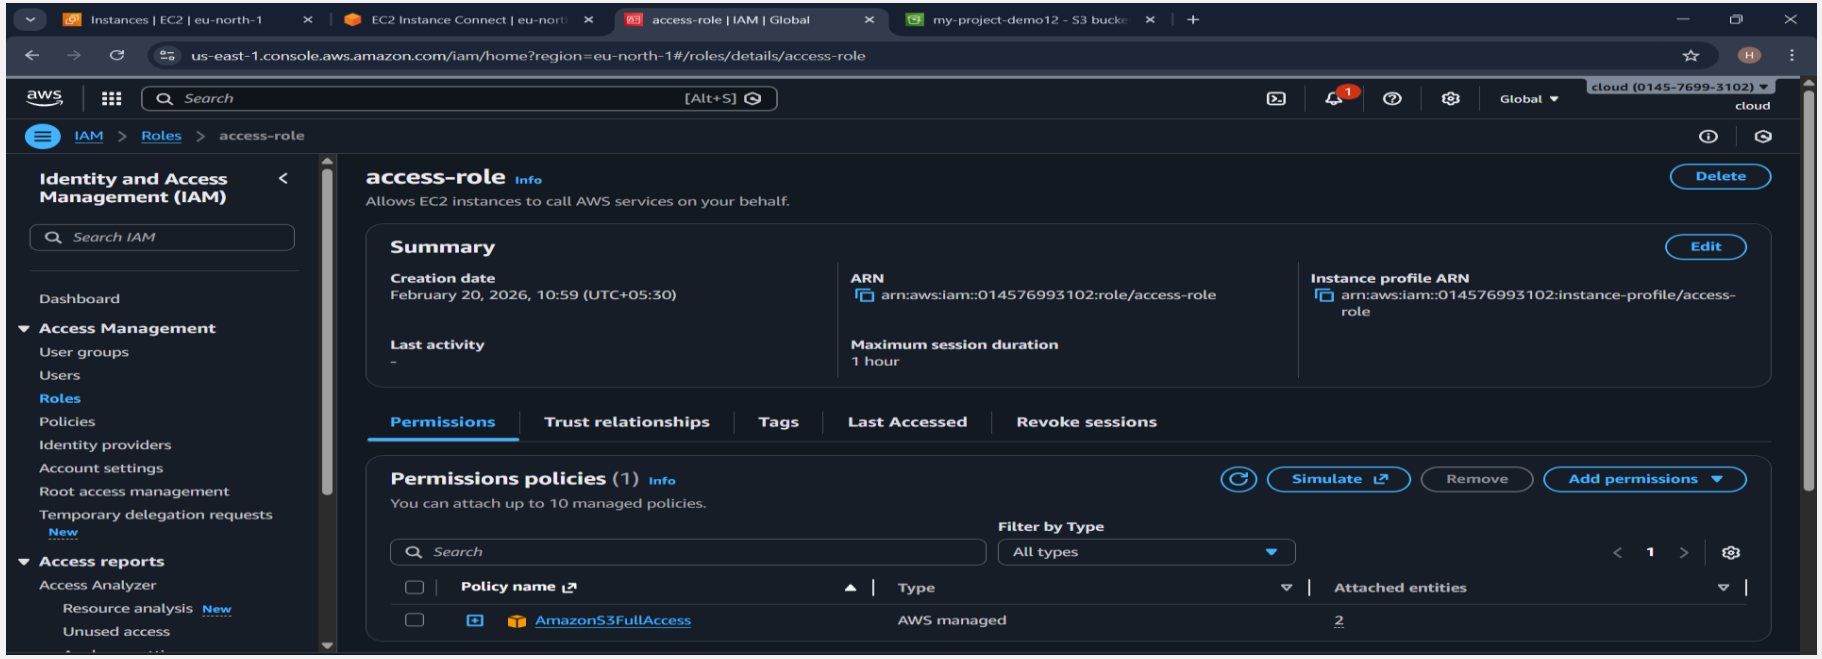
- Then we use public ip to display the output on browser



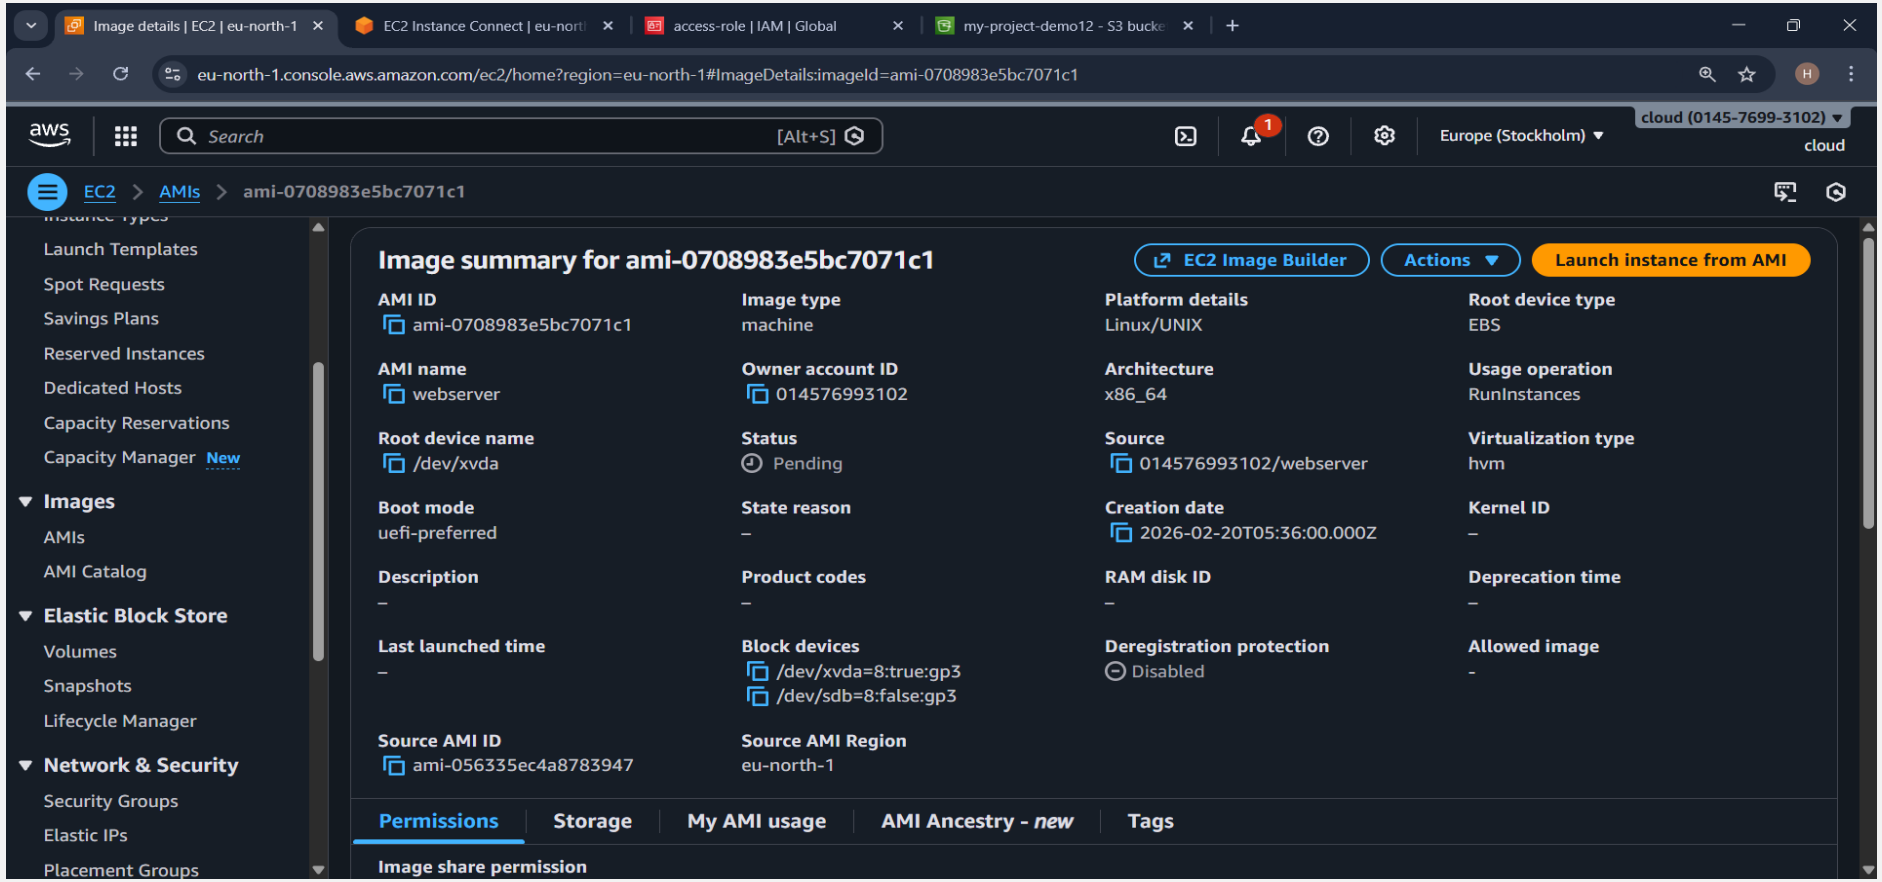
➢ STORE THE BACKUP IN S3
UNIQUE NAME, BUCKET PRIVATE



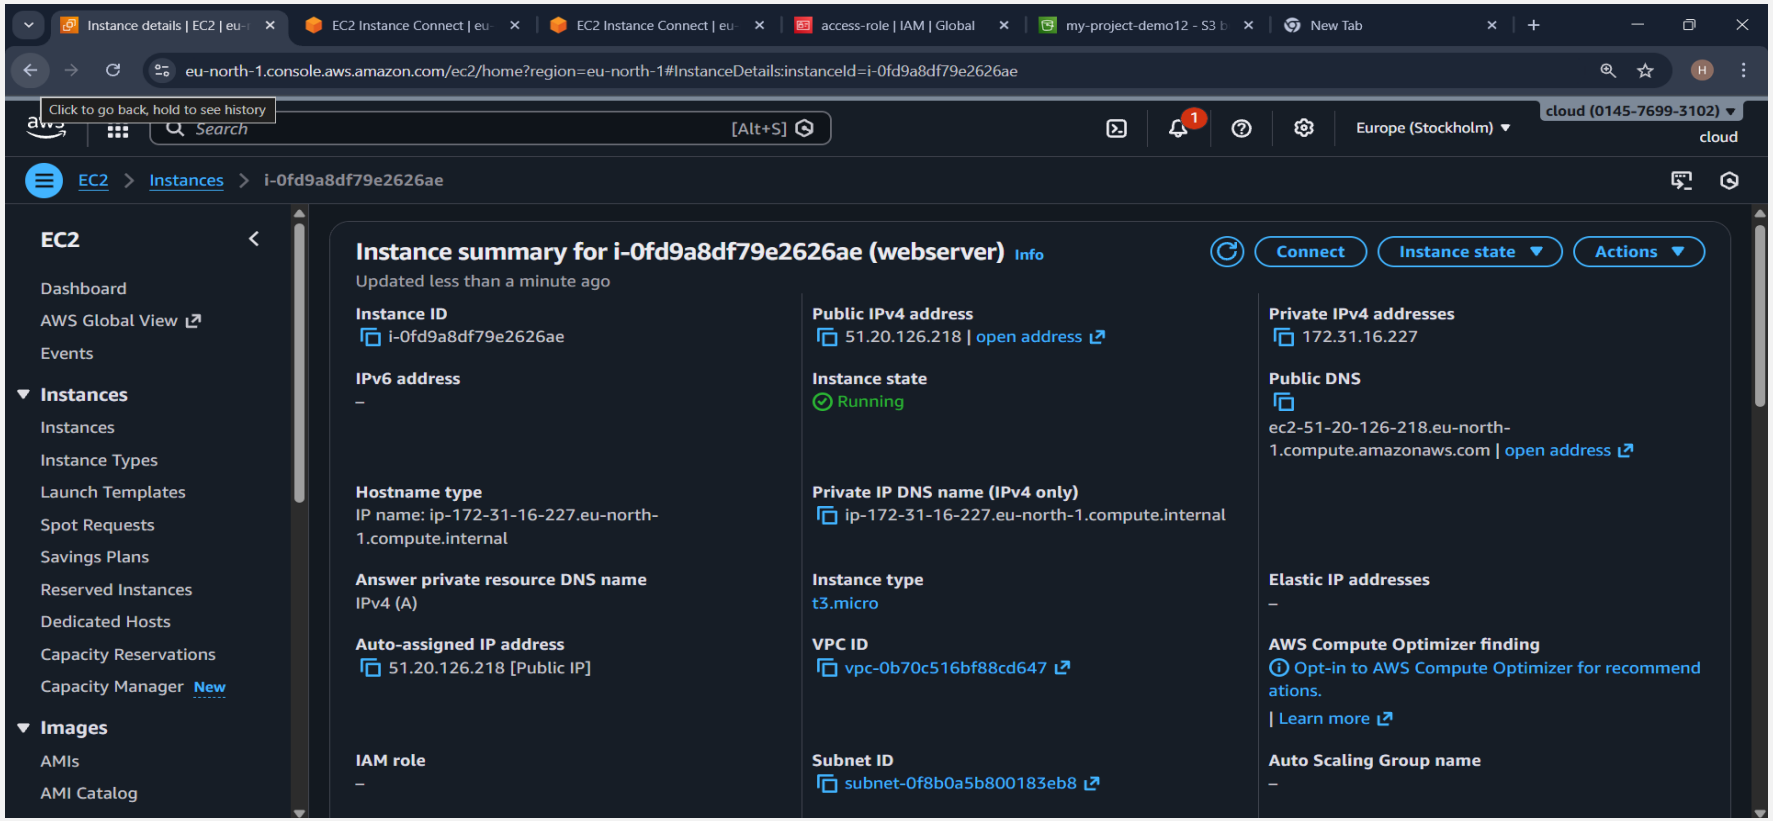
➢ Create IAM role. here we give s3 full access



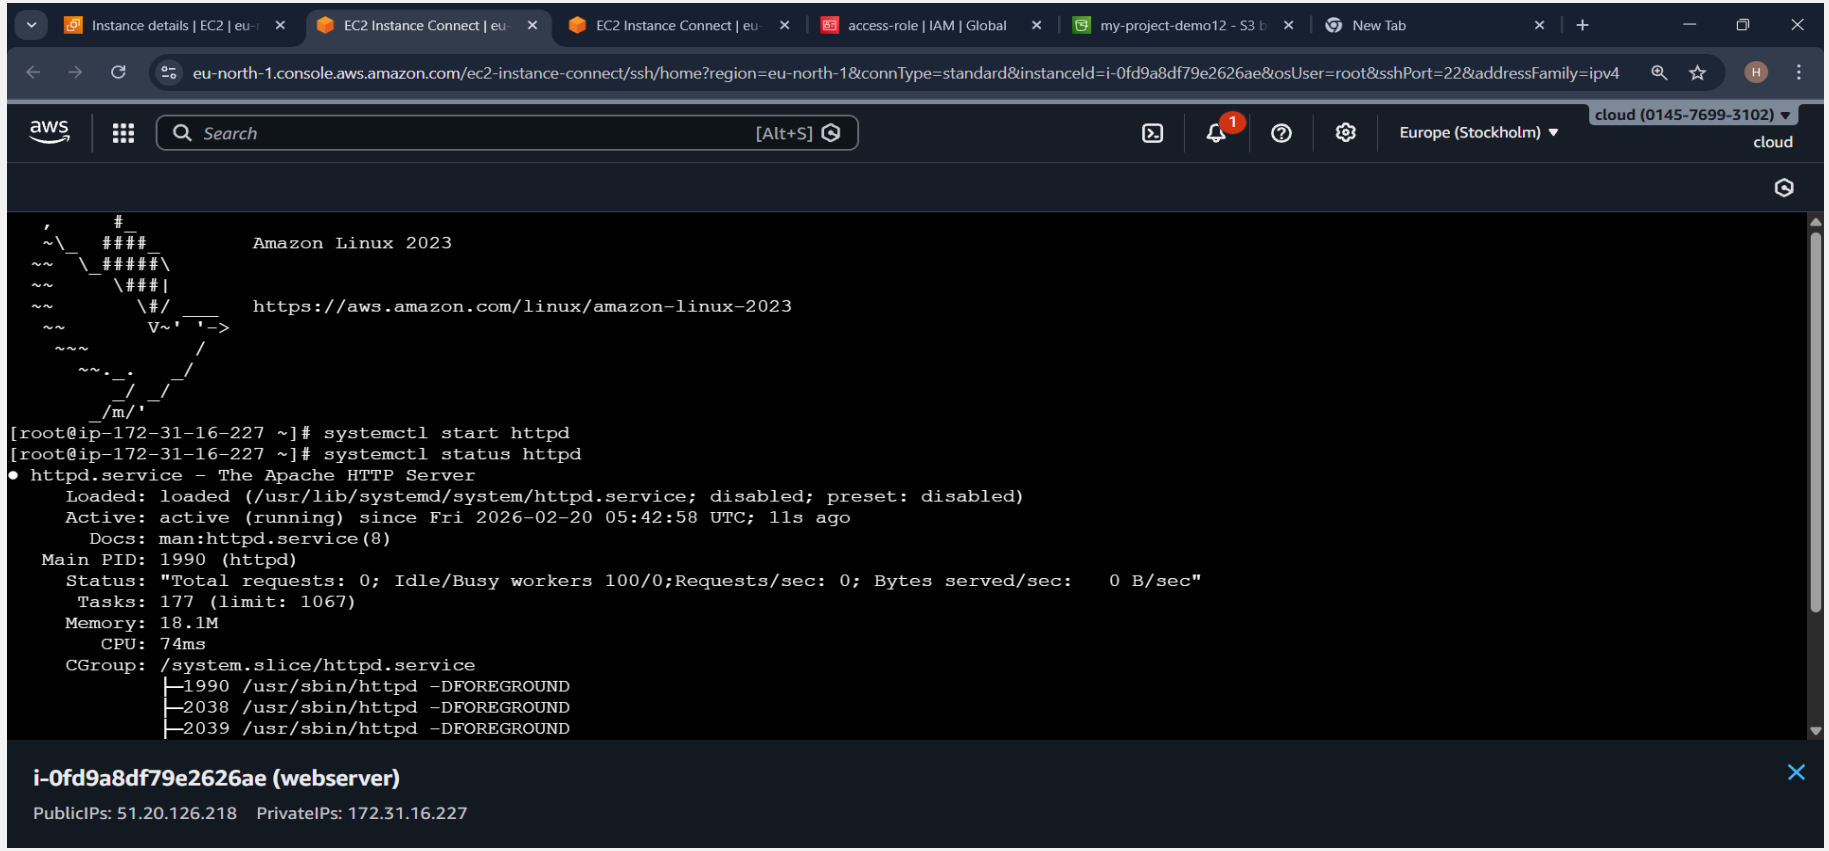
➢ Using instance we create AMI.

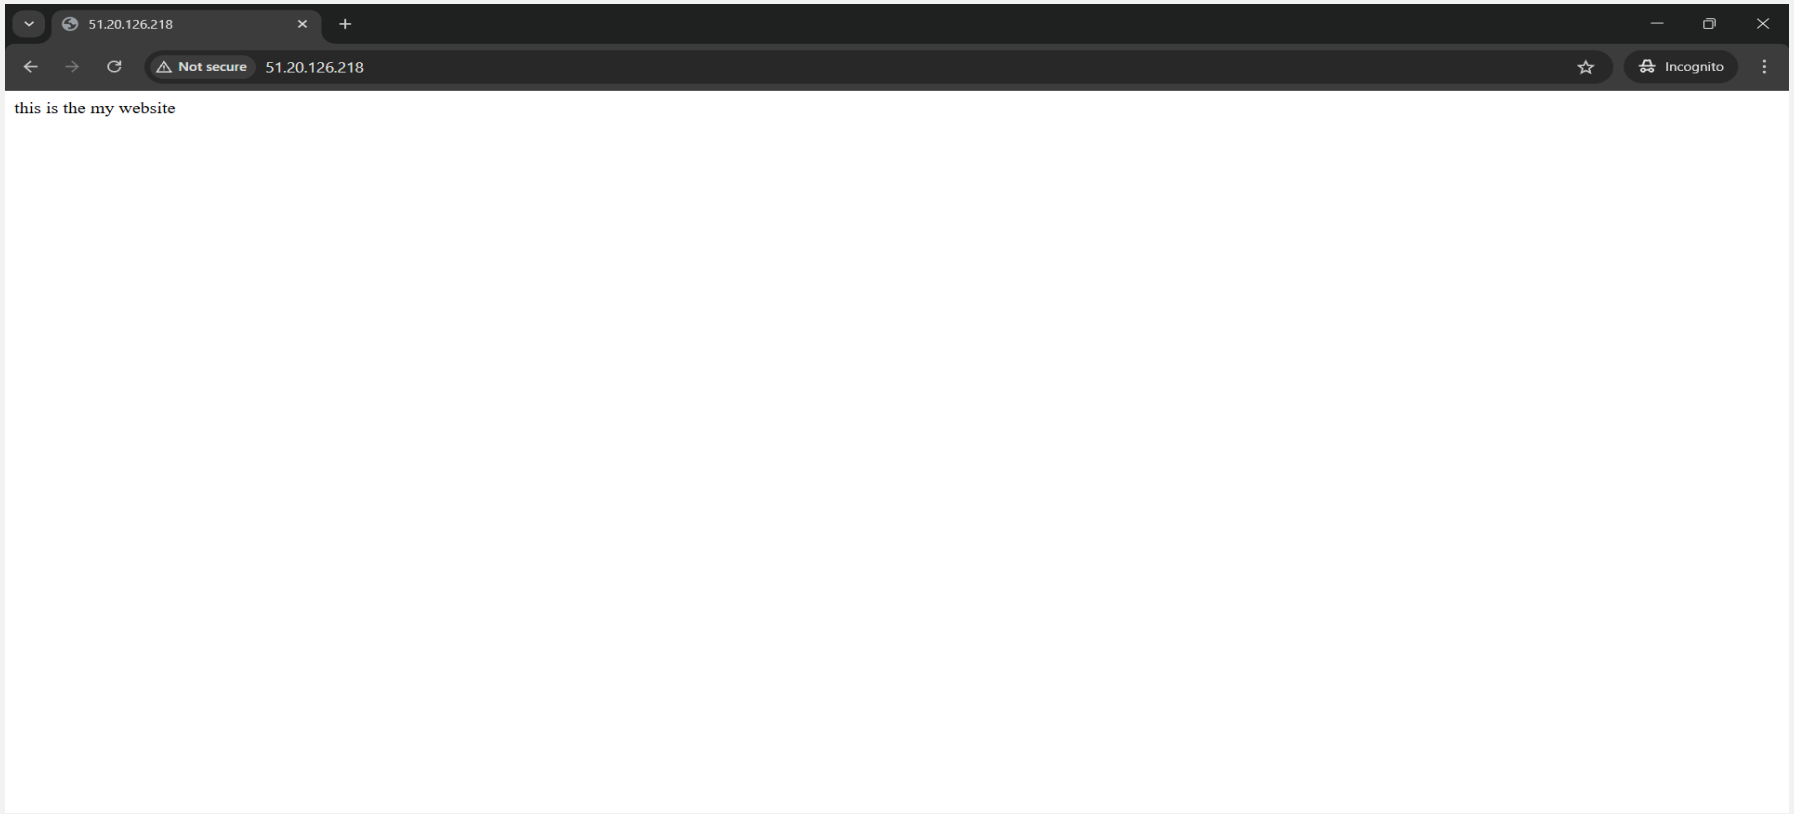


➢ By using ami we create instance



➢ Connect EC2 instance and start httpd





- Finally we can see same output.
